

Develop a Visual Basic program to serve as a simple calculator. Command buttons are to be used to allow input of numbers. The method for displaying results is the programmer's prerogative. The calculator will perform the operations of addition, subtraction, multiplication, and division. Use try catch statements for error detection to prevent division by zero. Your name should be included in a label in the bottom right hand corner of the form.

The due date for this program is Wednesday, October 5, 2005. Late assignments will not be accepted without prior authorization from the instructor.
