

Programming Assignment

Write a program to store names and numeric grades in a text file. Use a structure in a module to define a record and fields. Error detection is to be used to prevent the program from crashing.

The program should read any items that are in the file at program execution and display them in a listbox. When the user selects a name in the listbox, the corresponding letter grade is to be displayed in a textbox. The user will be allowed to enter new records and delete records.

Due date for the assignment is Wednesday, November 16, 2005.
